1 DP

1.1 Knuth Optimization

```cpp
for (int s = 0; s<=k; s++)                 //s - length(size)
        of substring
    for (int L = 0; L+s<=k; L++) {         //L - left point
        int R = L + s;                     //R - right point
        if (s < 2) {
            res[L][R] = 0;                 //DP base -
                    nothing to break
            mid[L][R] = l;                 //mid is equal to
                    left border
            continue;
        }
        int mleft = mid[L][R-1];           //Knuth's trick:
                getting bounds on M
        int mright = mid[L+1][R];
        res[L][R] = 1000000000000000000LL;
        for (int M = mleft; M<=mright; M++) { //iterating for M
                in the bounds only
            int64 tres = res[L][M] + res[M][R] + (x[R]-x[L]);
            if (res[L][R] > tres) {        //relax current
                    solution
                res[L][R] = tres;
                mid[L][R] = M;
            }
        }
    }
  int64 answer = res[0][k];
```

2 Data Structures

2.1 Fenwick Tree

```cpp
#define LSOne(S) (S & (-S))
vector<int> fen;
void ft_create(int n) { fen.assign(n + 1, 0); }
// initially n + 1 zeroes
int ft_rsq(int b)
{ // returns RSQ(1, b)
 int sum = 0;
 for (; b; b -= LSOne(b)) sum += fen[b];
 return sum;
}
int ft_rsq(int a, int b)
{ // returns RSQ(a, b)
```

```cpp
 return ft_rsq(b) - (a == 1 ? 0 : ft_rsq(a - 1));
}
// adjusts value of the k-th element by v (v can be +ve/inc
    or -ve/dec).
void ft_adjust(int k, int v)
{
 for (; k < (int)fen.size(); k += LSOne(k)) fen[k] += v;
}
```

2.2 Ranged Fenwick Tree

```cpp
//not tested
#define LSOne(S) (S & (-S))
vector<ll> fen[2];
void ft_create(int n) { fen[0].assign(n + 1, 0), fen[1].
    assign(n + 1, 0); }
ll ft_rsq(int b, bool bl)
{
 ll sum = 0;
 for (; b; b -= LSOne(b)) sum += fen[bl][b];
 return sum;
}
void ft_adjust(ll k, ll v, bool bl)
{
 for (; k <= (int)fen[bl].size(); k += LSOne(k)) fen[bl][k]
     += v;
}
void range_adjust(ll l, ll r, ll v)
{
 ft_adjust(l, v, 0), ft_adjust(r+1, -v, 0);
 ft_adjust(l, v*(l-1), 1), ft_adjust(r+1, -v*r, 1);
}
ll range_rsq(ll l, ll r)
{
 ll x=0, a, b;
 if(l)
 {
  a=ft_rsq(l-1, 0), b=ft_rsq(l-1, 1);
  x=(l-1)*a-b;
 }
 a=ft_rsq(r, 0), b=ft_rsq(r, 1);
 ll y=r*a-b;
 return y-x;
}
```

2.3 Sparse Table

```cpp
int n, arr[MAXN], table[MAXN][20], table2[MAXN][20];
int Log[MAXN];
vector<int> tmp, best;
int GCD(int a, int b)
{
 if(b==0) return a;
 return GCD(b, a%b);
}
void init(int n)
{
 int mx=0, l=0, r=n+1, lim=2, lg=0;
 Rep(i, MAXN)
 {
  if(i==lim)
  {
   lg++;
   lim*=2;
  }
  Log[i]=lg;
 }
 Rep(i, n) table[i][0]=table2[i][0]=arr[i];
 For(i, 1, Log[n]+1) for(int j=0; j+(1<<i)-1< n; j++)
 {
  table[j][i]=GCD(table[j][i-1], table[j+(1<<(i-1))][i-1]);
  table2[j][i]=min(table2[j][i-1], table2[j+(1<<(i-1))][i
      -1]);
 }
}
int get_gcd(int l, int r)
{
 int lg=Log[r-l+1];
 return GCD(table[l][lg], table[r-(1<<lg)+1][lg]);
}
```

3 Games

3.1 Declare Winner

```cpp
void declareWinner(int whoseTurn, int piles[], int Grundy[],
    int n) {
    int xorValue = Grundy[piles[0]];
    for (int i=1; i<=n-1; i++)
        xorValue = xorValue ^ Grundy[piles[i]];
    if (xorValue != 0) {
        if (whoseTurn == PLAYER1)
            printf("Player 1 will win\n");
        else
```

```
        printf("Player 2 will win\n");
    }
    else {
        if (whoseTurn == PLAYER1)
            printf("Player 2 will win\n");
        else
            printf("Player 1 will win\n");
    }
    return;
}
```

3.2 Grundy

```
// A function to Compute Grundy Number of 'n'
// Only this function varies according to the game
int calculateGrundy(int n) {
    if (n == 0)
        return (0);
    unordered_set<int> Set; // A Hash Table
    for (int i=0; i<=n-1; i++)
            Set.insert(calculateGrundy(i));
    return (calculateMex(Set));
}
```

3.3 Mex

```
int calculateMex(unordered_set<int> Set) {
    int Mex = 0;
    while (Set.find(Mex) != Set.end())
        Mex++;
    return (Mex);
}
```

4 Geometry

4.1 Angle Bisector

```
// angle bisector
int bcenter( PT p1, PT p2, PT p3, PT& r ){
 if( triarea( p1, p2, p3 ) < EPS ) return -1;
 double s1, s2, s3;
 s1 = dist( p2, p3 );
 s2 = dist( p1, p3 );
 s3 = dist( p1, p2 );
```

```
 double rt = s2/(s2+s3);
 PT a1,a2;
 a1 = p2*rt+p3*(1.0-rt);
 rt = s1/(s1+s3);
 a2 = p1*rt+p3*(1.0-rt);
 intersection( a1,p1, a2,p2, r );
 return 0;
}
```

4.2 Circle Circle Intersection

```
// rotate a point CCW or CW around the origin
PT RotateCCW90(PT p) { return PT(-p.y,p.x); }
PT RotateCW90(PT p)  { return PT(p.y,-p.x); }
PT RotateCCW(PT p, double t) {
  return PT(p.x*cos(t)-p.y*sin(t), p.x*sin(t)+p.y*cos(t));
}

// compute intersection of circle centered at a with radius
    r
// with circle centered at b with radius R
vector<PT> CircleCircleIntersection(PT a, PT b, double r,
    double R) {
  vector<PT> ret;
  double d = sqrt(dist2(a, b));
  if (d > r + R || d + min(r, R) < max(r, R)) return ret;
  double x = (d * d - R * R + r * r) / (2 * d);
  double y = sqrt(r * r - x * x);
  PT v = (b - a) / d;
  ret.push_back(a + v * x + RotateCCW90(v) * y);
  if (y > 0)
    ret.push_back(a + v * x - RotateCCW90(v) * y);
  return ret;
}
```

4.3 Circle Line Intersection

```
// compute intersection of line through points a and b with
// circle centered at c with radius r > 0
vector<PT> CircleLineIntersection(PT a, PT b, PT c, double r
    ) {
  vector<PT> ret;
  b = b-a;
  a = a-c;
  double A = dot(b, b);
  double B = dot(a, b);
  double C = dot(a, a) - r*r;
```

```
  double D = B*B - A*C;
  if (D < -EPS) return ret;
  ret.push_back(c+a+b*(-B+sqrt(D+EPS))/A);
  if (D > EPS)
    ret.push_back(c+a+b*(-B-sqrt(D))/A);
  return ret;
}
```

4.4 Circle from Three Points

```
Point center_from(double bx, double by, double cx, double cy
    ) {
  double B=bx*bx+by*by, C=cx*cx+cy*cy, D=bx*cy-by*cx;
  return Point((cy*B-by*C)/(2*D), (bx*C-cx*B)/(2*D));
}

Point circle_from(Point A, Point B, Point C) {
  Point I = center_from(B.X-A.X, B.Y-A.Y, C.X-A.X, C.Y-A.Y);
  return Point(I.X + A.X, I.Y + A.Y);
}
```

4.5 Closest Point on Line

```
//From In 1010101 We Trust cheatsheet:
//the closest point on the line p1->p2 to p3
void closestpt( PT p1, PT p2, PT p3, PT &r ){
 if(fabs(triarea(p1, p2, p3)) < EPS){ r = p3; return; }
 PT v = p2-p1; v.normalize();
 double pr; // inner product
 pr = (p3.y-p1.y)*v.y + (p3.x-p1.x)*v.x;
 r = p1+v*pr;
}
```

4.6 Convex Hull

```
// Compute the 2D convex hull of a set of points using the
    monotone chain
// algorithm. Eliminate redundant points from the hull if
    REMOVE_REDUNDANT is
// #defined.
//
// Running time: O(n log n)
//
//   INPUT:  a vector of input points, unordered.
//   OUTPUT: a vector of points in the convex hull,
    counterclockwise, starting
```

```cpp
//            with bottommost/leftmost point

#include <cstdio>

{
 if (i > R) {
  L = R = i;
  while (R < n && s[R-L] == s[R]) R++;
  z[i] = R-L; R--;
 }
 else
 {
  int k = i-L;
  if (z[k] < R-i+1) z[i] = z[k];
  else
  {
   L = i;
   while (R < n && s[R-L] == s[R]) R++;
   z[i] = R-L; R--;
```

```c
  }
 }
}
```

9   Theorems

9.1   Chinese Remainder

Chinese Remainder Theorem. System $x \equiv ai \pmod{mi}$ for i = 1, . . . , n, with pairwise relativelyprime mi has a unique solution modulo M = m1m2 . . . mn: x = a1b1 M m1 + + anbn M mn (mod M), where bi is modular inverse of M mi modulo mi . System $x \equiv a \pmod{m}$, $x \equiv b \pmod{n}$ has solutions iff a b (mod g), where g = gcd(m, n). The solution is unique modulo L = mn g , and equals: x a + T(b a)m/g b + S(a b)n/g (mod L), where S and T are integer solutions of mT + nS = gcd(m, n).

9.2   Gallai

a(G) := max{|C| | C is a stable set},
b(G) := min{|W| | W is a vertex cover},
c(G) := max{|M| | M is a matching},
d(G) := min{|F| | F is an edge cover}.
 Gallais theorem: If G = (V, E) is a graph without isolated vertices, then
a(G) + b(G) = |V| = c(G) + d(G).

9.3   Grundy

Grundy numbers. For a two-player, normal-play (last to move wins) game on a graph (V, E): G(x) = mex({G(y) : (x, y) E}), where mex(S) = min{n > 0 : n 6 S}. x is losing iff G(x) = 0. Sums of games.
Player chooses a game and makes a move in it. Grundy number of a position is xor of grundy numbers of positions in summed games.
Player chooses a non-empty subset of games (possibly, all) and makes moves in all of them. A position is losing iff each game is in a losing position.
Player chooses a proper subset of games (not empty and not all), and makes moves in all chosen ones. A position is losing iff grundy numbers of all games are equal.
Player must move in all games, and loses if cant move in some game. A position is losing if any of the games is in a losing position.

Mis'ere Nim. A position with pile sizes a1, a2, . . . , an > 1, not all equal to 1, is losing iff a1 a2 an = 0 (like in normal nim.) A position with n piles of size 1 is losing iff n is odd.

9.4   Konig

Knig theorem can be proven in a way that provides additional useful information beyond just its truth: the proof provides a way of constructing a minimum vertex cover from a maximum matching. Let {G=(V,E)} be a bipartite graph, and let the vertex set { V} be partitioned into left set { L} and right set { R}. Suppose that { M} is a maximum matching for { G}. No vertex in a vertex cover can cover more than one edge of { M} (because the edge half-overlap would prevent { M} from being a matching in the first place), so if a vertex cover with { |M|} vertices can be constructed, it must be a minimum cover.[10]
To construct such a cover, let { U} be the set of unmatched vertices in { L} (possibly empty), and let { Z} be the set of vertices that are either in { U} or are connected to { U} by alternating paths (paths that alternate between edges that are in the matching and edges that are not in the matching). Let
{ K=(L - Z) Union (R Intersect Z).}
Every edge { e} in { E} either belongs to an alternating path (and has a right endpoint in { K}), or it has a left endpoint in { K}. For, if { e} is matched but not in an alternating path, then its left endpoint cannot be in an alternating path (for such a path could only end at { e}) and thus belongs to { L- Z}. Alternatively, if { e} is unmatched but not in an alternating path, then its left endpoint cannot be in an alternating path, for such a path could be extended by adding { e} to it. Thus, { K} forms a vertex cover.[11]
Additionally, every vertex in { K} is an endpoint of a matched edge. For, every vertex in { L - Z} is matched because Z is a superset of U, the set of unmatched left vertices. And every vertex in { R intersect Z} must also be matched, for if there existed an alternating path to an unmatched vertex then changing the matching by removing the matched edges from this path and adding the unmatched edges in their place would increase the size of the matching. However, no matched edge can have both of its endpoints in { K}. Thus, { K} is a vertex cover of cardinality equal to { M}, and must be a minimum vertex cover.[11]
